Example 1: Let's consider a gene with only two alleles. In mice, Black fur color (BB or Bb) is dominant to brown fur color (bb). In a population of 100 mice, 36 mice are homozygous dominant (BB), 48 mice are heterozygous (Bb) and 16 are brown (bb). Relative frequency of B= # of B alleles in the population # of TOTAL alleles in the population

Figure 16-1 There are two main sources of genetic variation: mutations and the gene shuffling that results from sexual reproduction. Each of these babies has inherited a collection of traits. Some, such as hair color, are visible, while others, such as the ability to resist certain diseases, are not. Section 16-1 SECTION RESOURCES Print: • Laboratory Manual A, Chapter 16 Lab

Chapter 16 Evolution of Populations 16-1 Genes and Variation Darwin's original ideas can now be under-stood in genetic terms. Beginning with variation, we now know that traits are con-trolled by genes and that many genes have at least two forms, or alleles. We also know that individuals of all species are heterozy-gous for many genes.
